Rakeeb Hossain, Sunan Tajwar
CS-UY 3083
Final Project: Teamwork Summary

When creating the web application for our airline reservation system final project, there was an even distribution of responsibilities. To start, Sunan took care of setting up the backend server and database making sure that it was connected to the front-end react server. Rakeeb then took care of the registration procedures for customers and staff. Sunan then took care of the login tasks for both customers and staff. Sunan then created and completed all the home page responsibilities. From there, Rakeeb configured the majority of the authentication protocol for login and provided customers/staff with unique access to their respective pages/use cases. Sunan did all of the customer use cases and airline staff use cases 6, 8, 9, and 10. Rakeeb completed airline staff use cases 1-5, and 11. Both Rakeeb and Sunan worked on the logout procedures for customers and airline staff. Rakeeb was responsible for the majority of the CSS and styling of the web pages. Both group members met frequently over video and phone meetings to discuss recent changes that were pushed to the project repository and steps to take and tasks to complete before our next meeting. Both group members were also responsible for looking over and testing each other's code to catch/fix any bugs and/or discrepancies. Both group members also often referenced a playlist of tutorial videos on full-stack development in Node.js, MySQL, and React from youtube by PedroTech. The aforementioned playlist and channel are listed below.
